EXECUTIVE SUMMARY

SRSP was established in 1989 as a private, non government, non-profit organization with the objective of alleviating rural poverty at the gross root level through forming and strengthening broad based multi-purpose village level COs. It has six regional offices with its field offices designated as SOUs. So far a total of 1656 Schemes have been completed with financial assistance from different donors. Donor assistance has been under MVSP, BADP, PPAF-1 and some others like USAID, Novib and CIDA. Out of these 813 are DWS, 379 Link Roads and 180 irrigation schemes. The others include sanitation, land leveling and few other unclassified ones. Out of the total, 27% Schemes are allotted to WCOs, 11% to W/MCOs and remaining 62 % to MCOs.

A total of 495 Schemes are implemented under MVSP with financial outlay of 153.8 MRs and another 506 under in BADP in Kohat and Abbottabad regions with a total cost of Rs 100 million. PPAF-1 financed 468 Schemes with a total cost of Rs 128 million. Out of the total investment of 409 MRs, 93 % was provided under MVSP, BADP and PPAF-1. About 60% of investment made in PIs is in 4 years – 1997 to 1999 and 2001. Investment in 2000 was however, nominal.

Average cost of a Scheme is around 0.25 MRs ranging from as low as 0.11 MRs in 1991 to the highest one of 0.28 MRs in 1998. This includes a sum of Rs 25,000 spent on Scheme identification, management and supervision. Cost per Scheme fluctuates widely from year to year. Though the cost per scheme should have increased to accommodate the inflationary pressure but this is not reflected in cost figures. Low cost in recent years might have been due to poor standard of work/ quality of construction or comparatively lesser magnitude of work executed. However, this aspect could not be verified. The COs contribute about 20 % of total cost. In certain cases the contribution was more but it was much less in earlier years for the Schemes implemented under CIDA/ USAID.

Based on the findings of the Study, it was found that there are a number of socio-economic benefits enjoyed by the communities due to the implementation of various PIs. With availability of water near their houses, time saved per household is 0.80 hours of adult unit per day. The incidence of diseases has reduced with comparatively better water availabilities.

Due to the sanitation improvement, there is reduction in diseases with improved hygienic conditions, appreciation in the value of houses, less cost on maintenance of walls adjoining the streets with 'ponded water'. Number of patients has reduced to 3.0 persons per family per year from an average figure of 5.57 persons earlier.

Roads have benefited in the form of improved/ efficient communication, reduced passenger fare, reduced charges of wheat thresher, less cost of transportation for inbound/ outbound movement of goods, acceleration of economic activity, appreciation in the value of houses etc. Average level of benefits per Scheme is Rs 63,424 per year.

Agriculture related Schemes (Irrigation, Leveling) have benefitted the farmers in the form of higher cropping intensity and increased yields. The farmers had even changed their cropping pattern by raising high value crops like vegetables, orchards etc. At many places the tubewells were not functioning, thus no water in the channels. Due to poor maintenance of tubewells and drought conditions, the farmers are now reverting back to traditional cropping pattern. Cane crushers were supplied in Charsadda region only. But these primarily serve the interests of individual farmer and not the community.

On the basis of information collected through the field survey and secondary data available with SRSP, highest IRR is calculated for Road Schemes (23%) followed by DWSS (22%). Cane crushers yield the lowest return of just 5%. IRR for irrigation schemes is above 14%. This however, does not reflect the situation under normal conditions as these are the drought years. Further almost 15% of the investment on channel lining was not being utilized due to absence of

water at the source (streams/ wells/ tubewells) due to break down of tubewell, drought or less recharge.

Based on the returns from investment, the PIs are contributing significantly towards poverty alleviation. Per capita increase in the income of beneficiaries (direct/ indirect) is Rs 276 from Link Roads, Rs 188 from DWSS, Rs 154 from Sanitation and Rs 176 from Irrigation schemes, over their life period ranging from 8 to 15 years.

The visits to the site of selected Schemes and Regional offices led to conclude that:

- Sufficient and purposeful Baseline information is not available for purposes of monitoring/ evaluation;
- The pattern of record maintenance is not standardized and varies from one office to another;
- There is poor maintenance of some Schemes especially the Drains and Street pavement;
- Erosion due to monsoons is causing damage to the embankments at many places. However, the COs take interest in their maintenance;
- In general, DWS Schemes are maintained properly by the beneficiaries but there are instances of leaking pipes/ joints;
- Tubewells need comparatively higher maintenance and COs do not take interest in repairs once they break down;
- The farmers on whose farm the Cane crushers are installed, charge rent for their use from neighboring farmers even though they are the members of the COs;
- Women are allotted Schemes, generally DWS Schemes. They are however, not practically involved in implementation/ execution.
- In order to minimize the chances of personal bias in prioritizing of Schemes, there is need for evolving some mechanism.

1.0 GENERAL INFORMATION

1.1 Background

NWFP is the smallest province of the country in physical terms. It has a diverse topology ranging from scenic mountains and valleys in the north and west to lowlands converging on the Indus River in the east. Shelter related infrastructure in this province differ widely. Significant portion of the households rely on wells, ponds, rivers, streams/ springs as the primary source of drinking water. There are major problems of choking of drains, sewerage, accumulation of heaps of filth in the bazaars and solid waste management. Filthy ponds and solid waste accumulation in streets and vacant areas is very common. Road links are poor and inadequate. Rain-fed farming is practiced widely.

1.2 Introduction

Public awareness to amenities like clean water, sanitation, hygienic conditions, and need for developing low-cost infrastructure has increased over time. These activities are not taken up in low-income communities or rural areas, primarily due to financial constraints or lack of understanding of the need for such amenities on the part of rural/ neglected low-income urban areas or the slums. To overcome this, the emphasis of government and non-government agencies has shifted to these community-based projects, with financial assistance from the donors and seeking nominal up-front cash contribution from beneficiaries, for undertaking developmental works and a firm commitment to manage and promote sustainable arrangements for operation and maintenance.

1.3 Sarhad Rural Support Program (SRSP)

SRSP (formerly known as Sarhad Rural Support Corporation) was established in 1989 as a private, non government, non-profit organization with the objective of alleviating rural poverty at the gross root level through forming and strengthening broad based multi-purpose village level Community Organizations. It is modeled on the approach adopted by AKRSP based upon the concept that equitable and sustainable development cannot be attained without self-sustaining participation of local communities and that Community schemes reinforce a sense of unity and collective decision making amongst masses. SRSP is primarily based on the concept of social mobilization on the assumption that:

- The community as a whole can manage their own affairs through their representatives under the guidance of the experts;
- That upgrading the human skills, such as managerial, productive and cooperative skills will enable them to make best use of available resources;
- The poor and marginalized can do many things themselves;
- Provision of basic services like water supply, sanitation, link roads or removal of farm produce from the market under constraints will lead to increased living standards of rural masses;
- Gender discrimination will be lessened to a great extent by encouraging the sense of equality among men and women in various development schemes, and
- Access to health care especially for women and children reduces infant mortality.

To attain the above objectives, the following measures involve the involvement of labor and capital in the projects, considering the local conditions and the major characteristics of the area in the form of:

The approach is adopted. Initially confidence-building activities, organization (CO) and management, skill enhancement and training are undertaken. Later the projects are identified, prioritized and screened for implementation. SRSP bears 10-25% contribution from the CO as cash or in

SRSP activities spread over 11 districts falling in 6 Regions. These are as in Table 1 below:

Table 1 Geographical spread of SRSP activities

S.No	Region	Districts
1	Peshawar	1 – Peshawar 2 – Nowshera
2	Charsadda	1 – Charsadda
3	Kohat	1 – Kohat 2 – Hangu 3 – Kark
4	Mansehra	1 – Mansehra (i/c Balakot & Oghi SOUs) 2 – Battagram
5	Abbottabad	1 – Abbottabad 2 – Haripur
6	Chitral	1 – Chitral

1.4 Investment Schemes

The 'Productive Investment Schemes' or the 'PIs' as they are commonly referred to, involve small investments costing to about 3 – 4 lac rupees. These can broadly be classified amongst 7 categories that are as follows:

- 1- Drinking Water Supply including hand pumps, dug wells (tubewell at few places), piped supply from springs, and earthen dams;
- 2- Sanitation involving street pavement with or without drainage;
- 3- Link Roads or unmetalled 'kacha' jeepable tracks including widening of pedestrian passages, construction of embankments or protection walls and culverts to check erosion, causeways etc; —
- 4- Irrigation by installing tubewells, dug wells or from earthen dams;
- 5- Land leveling with bulldozer/ tractor including construction of protection walls for checking of erosion;
- 6- Supply of Cane Crushers for crushing of sugarcane at 'own farm' or 'near to the farm', , and
- 7- Miscellaneous Schemes that include advancement of credit for small enterprises (Dairy development, provision of 'Nuccas', tea cultivation, generally related to agriculture.

1.5 Specific Objectives

The Project aims at improving the living conditions of beneficiary communities by provision of basic infrastructure with the overall objective of increasing the productivity and well being of low-income groups. The strategy to attain the desired objective is as follows:

- infrastructure upgrading and community development in rural low-income settlements, and
- promote the use of demand-driven, participatory design procedures and affordable standards for infrastructure.

Specific objectives for the above said PIs as given in the Agreement reached between SRSP and the CO are as follows:

Water Supply

Meet the shortage of drinking water supply'
Improve health and provide hygienic conditions,

Save time in fetching water and consequently save time (of women), and
Save resources used for collection of water and to direct these resources to other productive activities.

Sanitation

Improve health and provide hygienic conditions,
Provide hygienic access to women and children,
Avoid stagnant pool of wastewater that causes different type of malarial diseases, and provide healthy environment by the pavement of unlined streets.

Link Roads

Easy access to market'
Reduction of workload on villagers,
Easy transportation of goods and agriculture machinery to the village,
Time saving, and
Health facilities.

Irrigation/ Leveling/ Lining

Control water losses from the watercourses,
Decrease farmer workload,
Minimize social disputes arising over shortage or theft of water in peak demand periods, and
Improve the productivity of existing land through better and timely availability of water,

1.6 Implementation

In order to encourage the Communities participate in undertaking developmental activities, active involvement is ensured through regular meetings, cash contributions, supervision during the construction stage and its post implementation maintenance. To attain these objectives, capacity building is taken as an important component. The beneficiaries are required to organize themselves as a Community Organization (CO), hold regular meetings, ensure participation of at least 75% of its members in their meetings, formulate Committees (Project, Audit and Maintenance with 2-4 members for each) to function under the umbrella of the CO. Women participation is encouraged by allocating certain number of Schemes for Women Community Organizations (WCO). The CO is required to maintain their accounts. For this purpose, training is imparted by SRSP.

1.7 The Assignment

The Assignment for impact assessment pertains to 'completed Schemes' only. It was to be completed within a period of one month, with the following specific Terms of Reference (TORs):

- What is the social impact of the component and which donor funded scheme has been more successfully implemented and indicate the reasons for success;
- What has been the impact of the CPI component on women. Special assessment of women's role in the implementation of CPIs should be made. In case of less involvement of women the consultant should suggest ways of improving their role in CPI implementation;
- An appraisal of economic impact should be made on type of CPIs indicating which is economically more viable. The consultant would use accepted economic techniques to assess the economic impact of CPIs. The economic impact would specially cover impact on women;
- The consultant would also analyze the poverty issue in the CPI component. For instance how many poorest members benefit from different types of CPIs that benefit the poorest the most.

2.0 APPROACH AND METHODOLOGY

2.1 Approach

The approach adopted briefly consists of collection of available information (raw/ processed), discussion with staff, field visits, interviews with the community members/ leaders to collect primary data and analyze it to derive meaningful indicators. Following paragraphs describe briefly the various steps involved:

2.2 Identification of Indicators

Considering the objectives and TORs and objectives given in the Agreement between SRSP and the CO, a set of indicators was designed for evaluation for assessment of each type of Scheme. These are as follows:

DWS

- Time saving in bringing water,
- No. of HHs benefited,
- Adequacy of water to meet beneficiary demand,
- Reduction in the incidence of water borne diseases like diarrhea, typhoid, skin related etc.,
- Maintenance/ upkeep of the Scheme,

Sanitation

- Appreciation of house value by lessened caving of water in walls & general cleanliness,
- Incidence & expenses on diseases caused by stagnant water,
- Time saving for 'Mosque goers' and general public,
- Loss of commodity with ponded passages,
- Decreased use of detergents for cleaning of splashed clothes

Link Roads

- Passenger fare,
- Fare for movement of commodities – agricultural and construction related,
- Appreciation in the value of houses due to better approach,
- Savings in the hiring rate of threshers/ tractors,
- Frequency of special trips of vehicles.

Land Leveling/ Irrigation

- Cropping pattern and area planted before Scheme,
- Yield before Scheme,
- Changes in cropping pattern,
- Changes in cropping intensity,
- Changes in crop yield,
- Price per unit, and
- Social cohesion of shareholders of watercourse,

2.3 Data Collection

Secondary data: It was collected from SRSP offices at Peshawar Headquarter and Regional Offices, for all the completed Pls. It included Scheme wise information regarding:

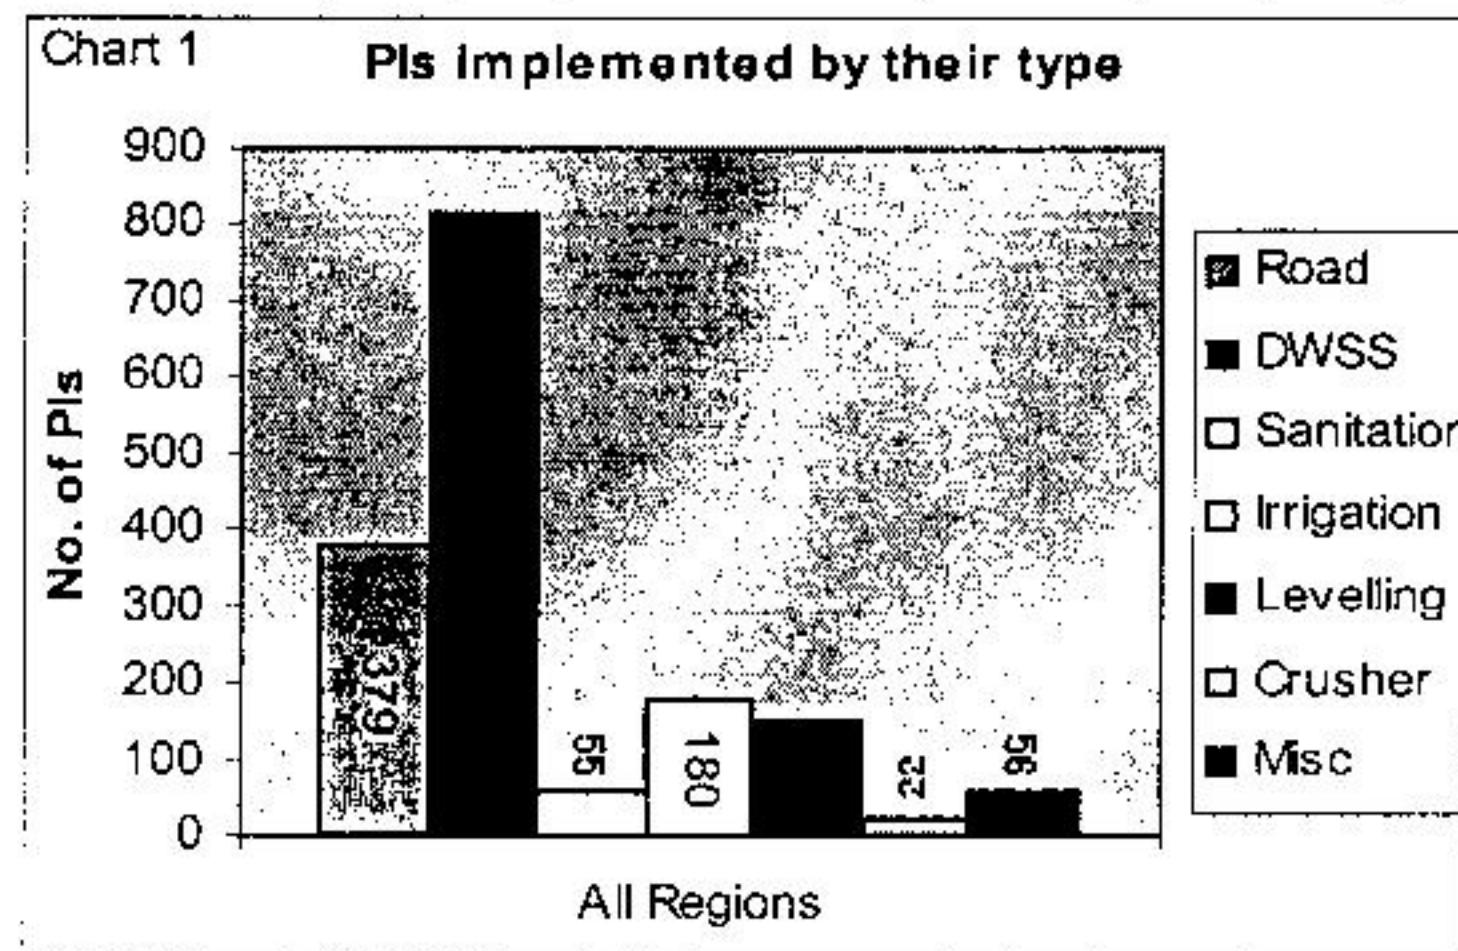

- Name of the Scheme with its location,
- Type of CO – men or women,
- Type of Scheme,
- Beneficiary Households,
- Cost with breakup of SRSP and CO contribution, and
- Completion date.

3.0

Implementation and Impact

3.1 Schemes Implemented

A total of 1656 Schemes have been implemented in various Regions. Out of these 49 percent are Drinking Water Supply Schemes (DWSS). Twenty three percent or 379 Schemes are of Link Roads. Investment for supply of Cane Crushers is only in Charsadda Region where 22 Crushers have been supplied (Chart 1). Highest number of PIs has been implemented in Mansehra (37%) Region followed by Kohat (32%). Only 58 or 4% of the PIs have been implemented in Peshawar Region. Land leveling has been carried out under 151 Schemes, mainly in Kohat (66%) and Mansehra Region (27%). The Regional Offices maintain statistics for various Schemes at SOU level. This includes information on the type of CO (men, women or joint), number of beneficiaries (direct/ indirect), cost of the Scheme, contribution by the Community, date of approval/ commencement and date of completion. Various Schemes implemented are detailed in Annex 3 for each Region².

Schemes implemented in various SOUs in different years are given in Appendix Table 1. Summarized figures are given in Table 3 below.

Table 3 PIs implemented by their type in different Regions

Type	Percent of PIs implemented in Region					100 =	
	Charsadda	Kohat	Mansehra	Peshawar	Abbottabad	All	No
DWSS	11%	39%	33%		17%	49%	813
Sanitation	20%	36%	18%		25%	3%	55
Irrigation	10%	25%	24%	27%	14%	11%	180
Leveling		66%	27%		7%	9%	151
Crusher	100%					1%	22
Road	9%	9%	58%	3%	22%	23%	379
Misc	25%	36%	39%			3%	56
Total	11%	32%	37%	4%	16%	100%	1656
100 = No	187	536	605	58	270	1,656	

3.2 PIs implemented by various Donors

There are 3 main donors viz. MVSP, PPAF (Phase 1) and BADP. Out of a total of 1656 Schemes implemented so far, highest number viz. 495 is implemented under MVSP with total cost of Rs 153.8 MRs. Under BADP, 437 Schemes are implemented out of which

² The titles and sequence of various Columns may be different than what is given in Regional Offices. But the contents are the same. The Serial Number of the Schemes is also the same as has been recorded in said offices. It might however, be blank for some as different files are merged together without allotting any Number.

Primary data: All the Schemes were classified into 7 groups and a representative sample spreading over all the Regions was drawn for detailed interviews with the beneficiaries. Miscellaneous schemes though shown separately in the Tables, are generally related to agriculture. A total of 61schemes were visited and 423 persons form these PIs interviewed (Table 2).

Table 2 PIs visited and respondents interviewed for Primary Data Collection

Scheme type	Peshawar	Charsadda	Abbottabad	Kohat	Mansehra	Total
A - No. of PIs						
DWS	3	2	4	3	4	16
Sanitation	2	2	2	2	3	11
Link Roads	3	1	2	3	5	14
Irrigation	4		2	6		12
Land leveling	1		2	2	1	6
Cane crushers		2				2
Misc.						0
Total	13	7	12	16	13	61
B - No. of respondents						
DWS	18	13	26	19	24	100
Sanitation	18	12	20	16	21	87
Link Roads	19	6	13	21	26	85
Irrigation	25		19	44		88
Land leveling	6		18	21	5	50
Cane crushers		13				13
Misc.						0
Total	86	44	96	121	76	423

Primary data was collected from beneficiary respondents using the Questionnaire attached as Annex 1. Keeping in view the nature of PIs and varied nature of benefits, data was collected on tabulation forms designed specifically for each type of Scheme. Emphasis was however, placed on the information gathered from Key respondents or group discussions for each selected Scheme. Brief notes for some of the PIs visited during the course of Field Survey are given in Annex 2.

2.4 Data Analysis/ Processing

Analysis of Primary data has been carried out taking the entire province as one unit¹. The results are subsequently applied to Region level analysis. Data analysis is made keeping in view the indicators given earlier, for each type of Scheme.

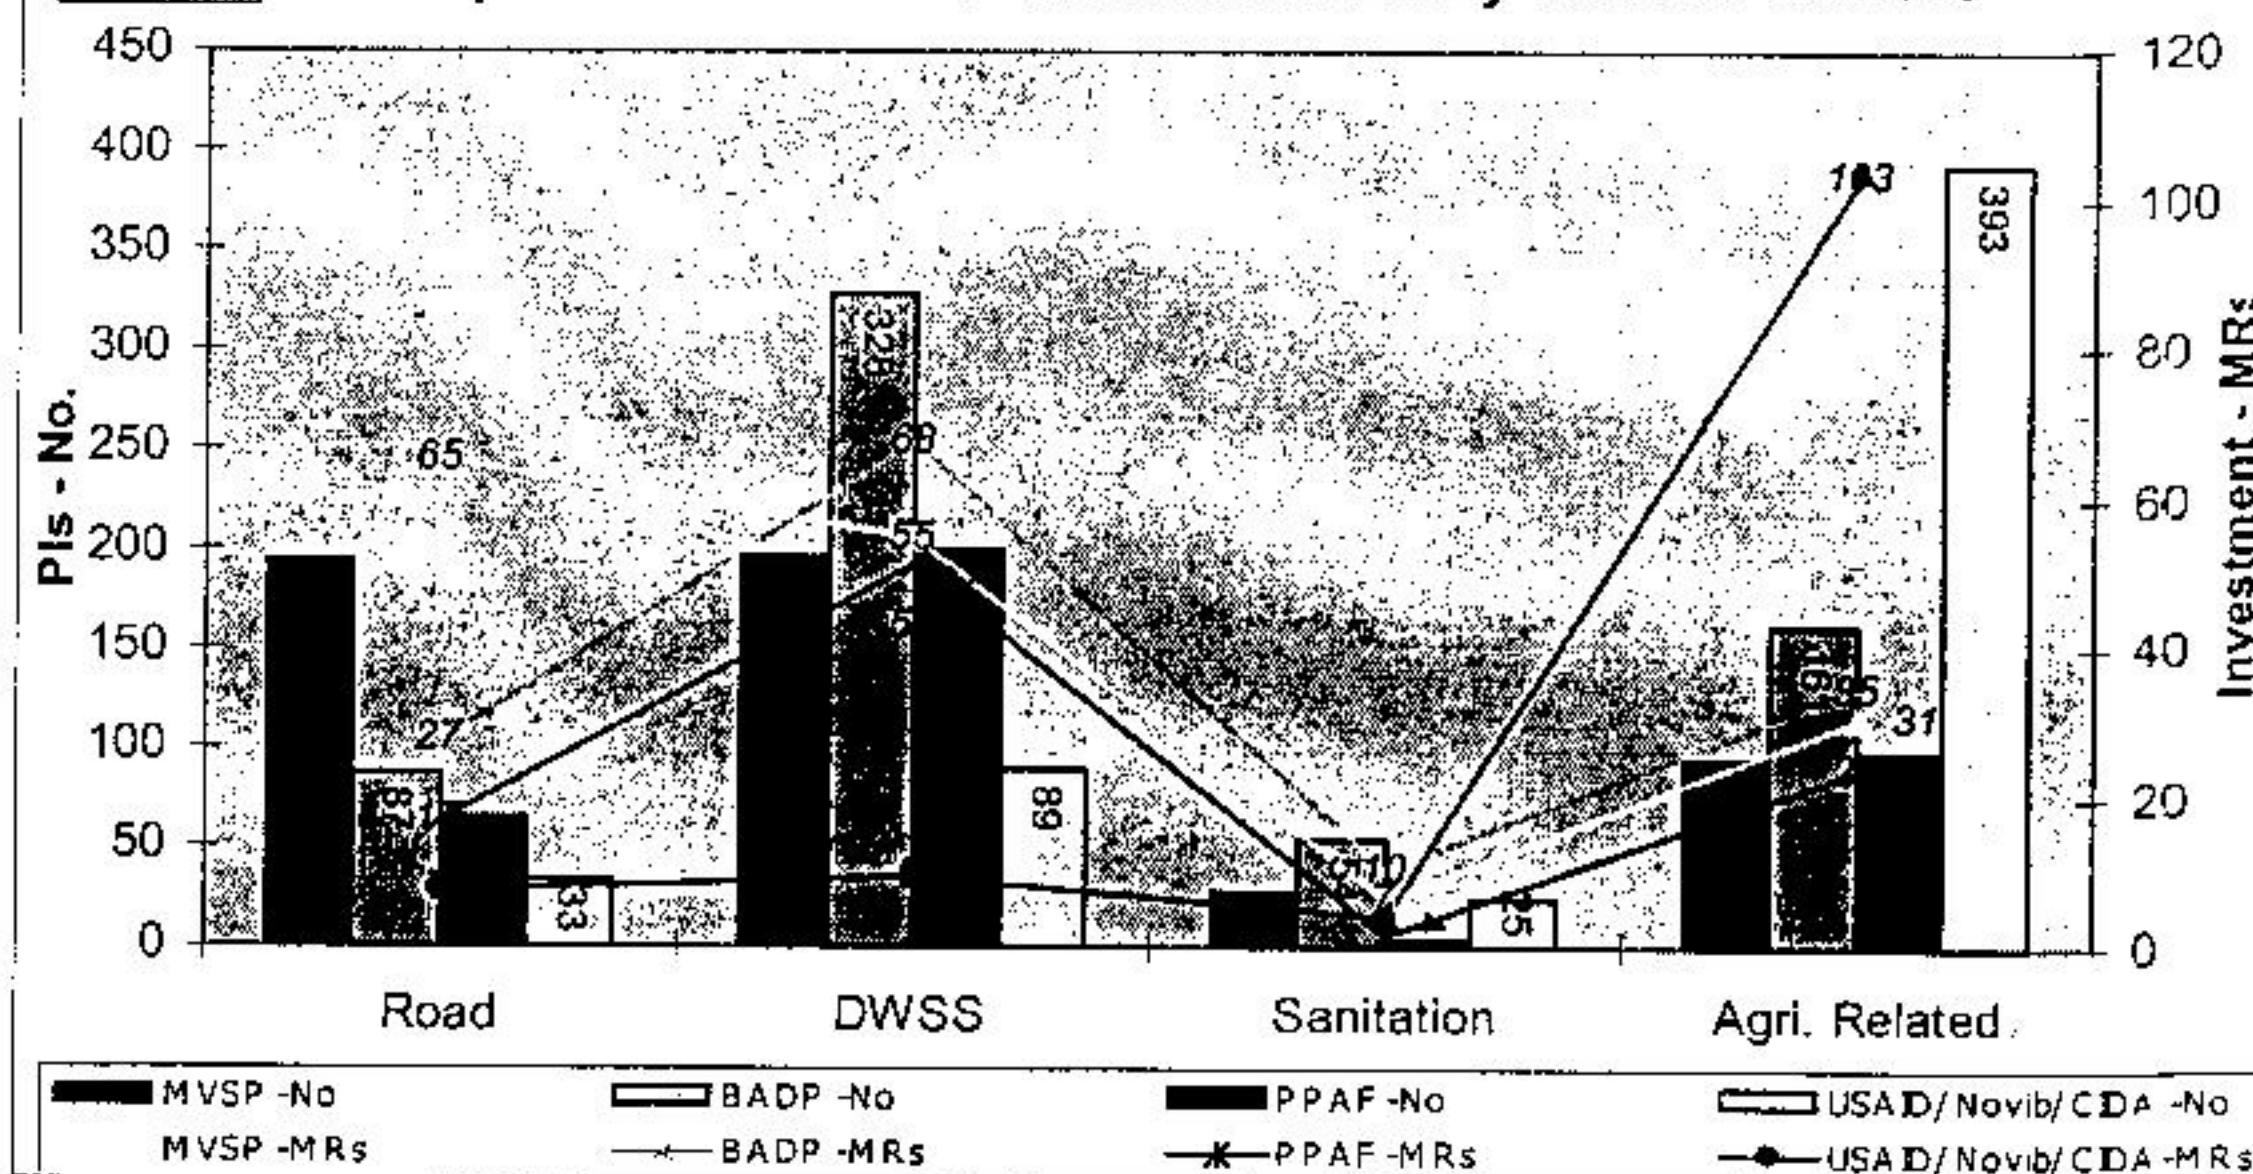

¹ In view of the time and resource constraint and homogeneity of benefits from each type of Scheme in various areas, data collection was not confined to the level of a district or the Region.

354 are in Kohat Region (70.9 MRs) and remaining 83 in Abbottabad Region (18.6 MRs). In all 468 Schemes are implemented under PPAF-1. Region wise spread of these is 187 in Abbottabad (55 MRs), 110 in Mansehra (33 MRs), 113 in Kohat (28.8 MRs) and remaining 58 in Peshawar Region (11.2 MRs). In addition, some Schemes (187) were implemented in Charsadda Region by CIDA/ Novib/ USAID with a total cost of Rs 27.7 million rupees (MRs). Table 4 shows the number of Schemes implemented in various Regions under various programs, also given in Chart 2³.

Table 4 Schemes implemented by Regions and Donors

Type/ Region	Mansehra		Kohat		Charsadda		Abbottabad		Peshawar		Total
	MVSP	PPAF-1	BADP	PPAF-1	US/Nvb/CD	PPAF-1	BADP	PPAF-1

Chart 2 Pls implemented and Investment made by various Donors

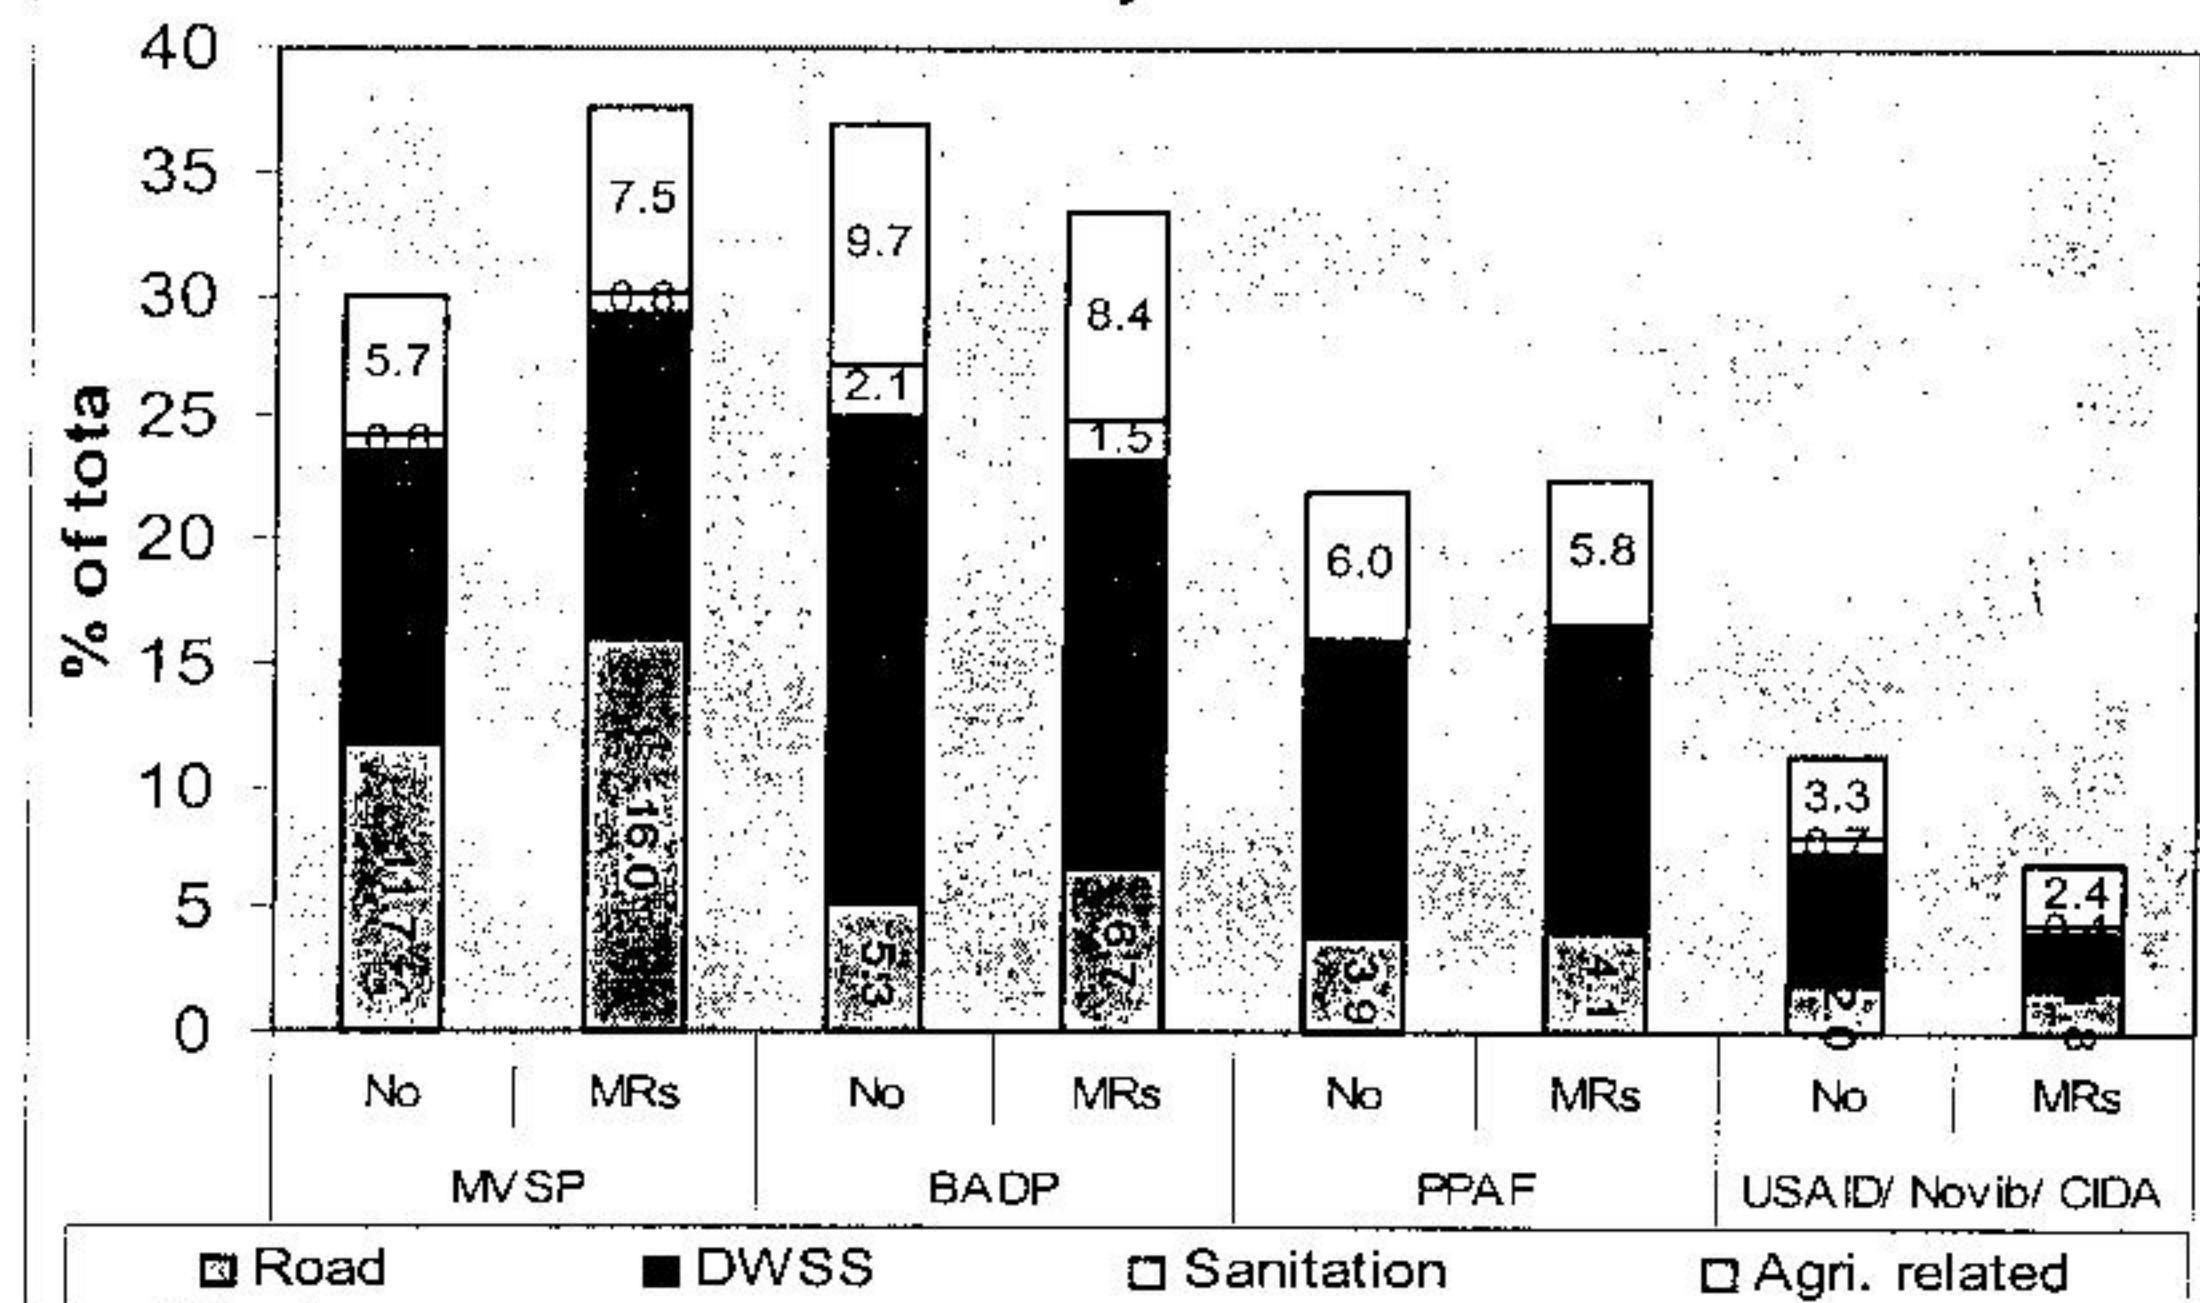

³ Irrigation, Leveling, Cane Crushers and Misc. Schemes (mostly supply of Gypsum or Dairy package) are grouped as 'Agri. Related' in Chart 2, 3 and 4.

Contribution of various donors has been analyzed in relative terms. Out of the total investment of 409 MRs, highest contribution viz. 37.6 percent is made under MVSP followed by BADP (33.3%). The number of Schemes implemented is however, more under BADP (36.8%) against 29.9% under MVSP. The pattern of Schemes selected is almost similar with the exception that no Sanitation scheme has been implemented under PPAF-1. BADP however, funded the highest number of DWS Schemes (19.8 %). Cane crushers are supplied only under USAID/ Novib programs. Table 5 shows share of various donors in PIs implementation, also depicted in Chart 3.

Table 5 Share of various Donors in implementation of PIs

Type	MVSP		BADP		PPAF		USAID		Novib		CIDA		Total	
	No	Cost	No	Cost	No	Cost	No	Cost	No	Cost	No	Cost	No	Cost
Road	11.7	16.0	5.3	6.7	3.9	4.1	0.2	0.2	1.8	1.5			22.9	28.5

Chart 3 PIs and Investment by Donors as % o total

3.3 Pace of Implementation

With the establishment of SRSP in 1989, a start was made in FY1990 for undertaking community welfare ventures. The pace of development was very slow till FY 94. Only 34 Schemes were implemented by this time. However, under the MVSP and BADP in FY 94, the momentum of PIs picked up. Again with drying up of funds, 111 Schemes were

implemented in 2000. Only 38 Schemes are implemented in 2002⁴. Table 6 shows year-wise breakup of Schemes implemented.

Table 6 PIs implemented in various years

Year	DWSS	Sanitation	Irrigation	Leveling	Crusher	Road	Misc	Total
90							2	2
91			2				1	3
92			6		3	4	9	22
93			4		3			7
94	2			1				3
95	43		4	3	2	7		59
96	92	4	18	19	2	25	3	163

99	148	18	17	20		79	4	286
2000	66	6	6	22		11		111
2001	202	1	50	25		59	4	341
2002	9	3	20			6		38
Total	813	55	180	151	22	379	56	1656

3.4 Gender participation

One of the primary objectives of any RSP is to encourage women to participate equally in all walks of life. Due to orthodox religious culture, women are however, not fully involved in implementation/ decision-making. It is however, mandatory for SRSP to motivate women to participate in developmental activities. More than 1/3rd of the Schemes are implemented as WCO Schemes though they are practically not involved in their execution. Appendix Table 2 shows formation of COs in various years in different SOUs.

In order to motivate and ensure women participation, their participation is made necessary in various sub committees constituted for Scheme implementation. Table 7 shows the number of Men Community Organization (MCO), the WCOs and the joint Women/ Men Community Organizations (W/MCO). Out of the total of 1656 COs, 62% are MCOs, 27% WCOs and remainder joint or W/MCOs. DWS and Sanitation Schemes are generally allotted to WCOs as evident from the following Table.

Table 7 Number and Percent of COs by Gender

Type	No. of COs				Percent of total			
	MCO	WCO	W/MCO	Total	MCO	WCO	W/MCO	Total
DWSS	388	305	120	813	48%	38%	15%	100%
Sanitation	35	12	8	55	64%	22%	15%	100%
Irrigation	146	23	11	180	81%	13%	6%	100%

⁴ DFID Schemes implemented since December 2001, are not included for review in this Assignment.

3.5 Investment in Pls

A total of 409 MRS has been invested on 1656 Schemes in different areas. Highest investment of Rs 183 million has been made in DWSS. Roads are next line with an investment of Rs 117 million followed by land leveling. Table 8 shows year wise investment in different Pls.

Table 8 Investment made in Pls in different years – MRs

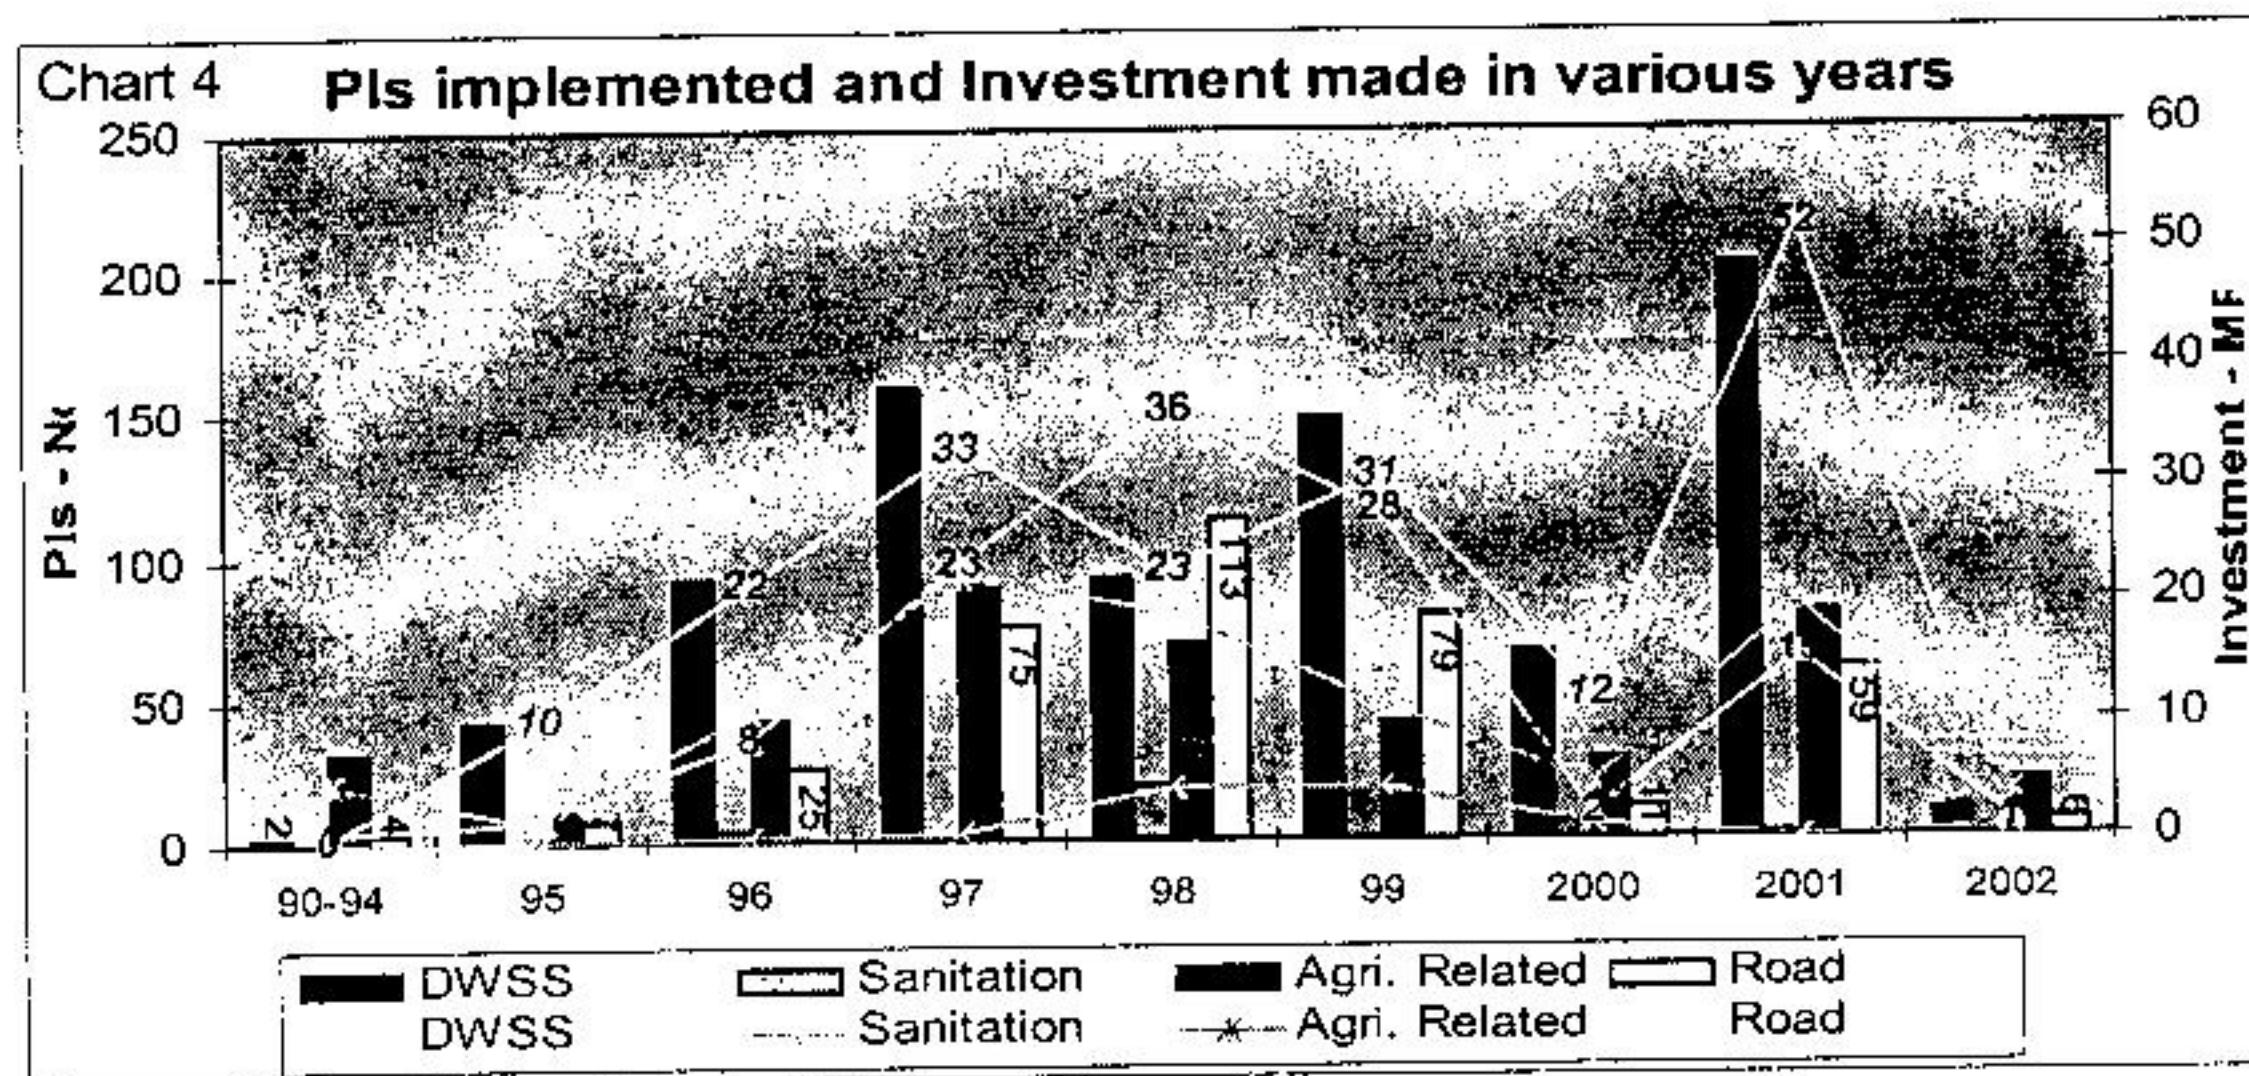

Year	DWSS	Sanitation	Irrigation	Leveling	Crusher	Road	Misc	Total
90							0.3	0.3
91			0.3				0.0	0.3

Total	183.1	11.1	48.5	35.8	3.0	116.6	11.2	409.4

Costs incurred in various years have been analyzed in relative terms in Table 9. There has been nominal investment from 1990 to 1995, 2000 and 2002. Highest investment of 21.2% was made in 2001 followed by 1998 (20.2 %). In line with the number of highest number of DWS Schemes, 45% of total investment has been made in these Schemes, followed by Roads (28.5 %) and Irrigation (11.9 %). Funds invested and Pls implemented are shown in Chart 4, for an easy grasp⁵.

⁵ Labels for Sanitation Schemes (Investment & No.) and Investment Series for Agri. Related Schemes is not shown in the Chart.

3.6 Community Contribution

Involvement of beneficiary community in terms of financial contribution or in kind, is pivotal to ensure its sustainability. Such contribution to a minimum level of 20% is mandatory. CO share in total cost of schemes implemented ranged from 11 to 32 percent excluding the Schemes implemented under CIDA and USAID in Charsadda Tehsil. Average weighted Community share for the Schemes financed by these donors (CIDA? USAID) was only 0.1 and 6 percent respectively. Contribution for MVSP ranged from 5 to 15% or say about 10%. The communities contributed in the form of labor or in kind. Table 10 shows weighted average contribution by COs by type of the Scheme in different SOUs. Contribution as a percent of total cost of the Scheme is also given therein.

3.7 Average cost

Average cost of a Scheme is around Rs 0.25 million ranging from as low as 0.11 MRs in 1991 to the highest figure of Rs 0.28 MRs in 1998 as shown in Table 11, also depicted in Chart 5. Apparently the magnitude of Scheme in physical terms is the same at present as it was few year back. However, the trend does not depict any impact of cost inflation in succeeding years. Assuming that the quality of works does not suffer and that the scope of the Scheme in physical terms does not change, vide variations (upward and downward) in cost, is not understandable. Cost per beneficiary HH could not be ascertained⁶ as the number of beneficiary households (HH) assumed by executors is not a reliable indicator.

⁶ The number of beneficiary HHs is not given for many Schemes in the record maintained by the SOUs. Further there is wide variation in the perception of field staff as to who actually the beneficiaries are. The number of 'Indirect beneficiary HHs' is given by few but not by others. The 'Direct' beneficiary HHs varies from 23 to 500.

Chart 5 Average cost per Scheme in various years - 000 Rs

3.8 Cost at 2002 price level

Investment in PIs is being made since 1990. Since the evaluation (impact assessment) is made in 2002, the costs need to be brought to the same time horizon as it pertains to measuring the benefits. It is done by using the GDP deflators given in Appendix Table 3 for various years. The cost calculated at 2002 price level for various types of Schemes is given below in Table 12. Using the weighted figures for the Schemes implemented and cost incurred, average cost per Scheme works out to 0.29 MRs.

Table 12 Average cost/ Scheme in different years at 2002 Price Level – 1000 Rs

Total	257	226	315	272	178	353	253	285

3.9 Benefits

Based on the primary and secondary data, benefits have been worked out as explained in various Sections. In the absence of reliable statistics for the number of beneficiary households, average number of HHs benefited is taken as 32 for all type of Schemes. Other assumptions made for each type of Scheme where applicable, are as follows:

- Average family size per HH calculated on the basis of secondary data, is 7.5 individuals;
- The time saved by various interventions, is converted to man days (mdy) of 8 hours and is taken as 'unskilled' labor;
- Time saving for children is taken as 0.5 adult unit;
- Rate of labor is Rs 75 per mdy for men and Rs 40 for women;

3.9.1 Drinking Water Supply

Various types of DWS Schemes are hand pumps, dug wells, and piped supply from springs or tubewell at sporadic places. At few places, DWS is the secondary objective of an Irrigation Scheme. Data collection pertained to time consumed in bringing water before and after Scheme implementation, incidence of diseases, water shortages if any, maintenance expenses etc. Following coefficients have been derived on the basis of figures given in Appendix Table 4.

- An average of 1.70 hours of women and 2.03 hours of children was consumed per day per HH for bringing water for domestic use from streams/ springs. It has now decreased to 1.0 hour – 60% by women and 40% by children, with weighted average figure of 0.80 hours of adult unit (child as 0.5 of adult).
- Time taken for bringing water from wells is 1.13 hours (80% adult + 20% children) against 1.25 hours previously;
- There was no significant impact of decreased diseases compared to pre-Scheme period. It is probably due to the reason that there are many bacteria from rusted pipes, suction from joints, air etc. like as these are in the water supplied even in Metropolitan cities. However, at 2 sites (in Mansehra Region),

the residents reported stomach problems/ boils on the body⁷. Based on the information of these 2 sites, a small amount of Rs 18.31/ Scheme/ month or Rs 220 (weighted figure) is taken as the benefits on this account;

- The cost for a dug well could not be calculated in the absence of statistics like number of wells for a Scheme or its depth. It is however, assumed as Rs 320,000 per Scheme (about 7 Wells) with beneficiaries as 35 per Scheme;
- The Schemes are designed taking an average consumption of only 20-gallons/capita/ day. At few places, the wells or the piped supply of water is not sufficient to meet the domestic needs of growing population⁸. The water depth in some of the wells has also increased leading to water shortages, especially in recent drought years. This factor is however, not considered in planning Water Supply Schemes of such a small magnitude;
- Maintenance cost of hand pump (HP) or the well computed on the basis of information from the field, is computed as Rs 100/ HH/ month.

3.9.2 Sanitation

Drains serve as a permanent abode of mosquitoes, flies and insects. Animal waste and other solid waste are also dumped in these drains threatening the environment and health of the people. In the absence of street pavement or provision of drains, water from inside the house and escapes, accumulates on the streets that are frequently at lower level than the adjoining house yards. This water remains ponded on the passages/streets almost permanently. In the monsoon season, 'pucca' bricks or stones are placed at many places for crossing over. The mosquitoes multiply at a faster rate at ponded streets leading malarial diseases. The drainage of dirty water from the streets often escapes to the wells through the sub soil arteries. The 'Namazis' going to the mosques, have to adopt the lengthy route to save their clothes from splashed dirty water. The water from the streets often finds its way inside the adjoining walls of houses (caving) and resultantly the falling of walls. The approach to the house is the single most determining factor for its value. With stagnant water, pits are developed due to the passing of loaded vehicles (tractors, pick-ups, carts etc.) leading to added wear and tear.

The Schemes consist of street pavement with or without drains. At few locations, latrines are also constructed. Considering the above said aspects, the views of beneficiary HHs were sought. Based on the Field Survey information, the benefits on account of improved sanitation are calculated as follows:

- Number of patients/ family/ year decreased from 5.57 persons to 3.0 persons. Average expenditure per patient for each visit, including medical expenses, is Rs 82.14 and thus a saving of Rs 6759/ annum for a Scheme benefiting 32 families;
- Saving from decreased incidence of disease attack leads to saving of time available for labor. Valued at Rs 75/ man day (unskilled), for 30% of the patients assumed as male adults, income foregone is Rs 1851/ Scheme/ annum;
- The number of clothes to be washed/ family/ year decreased by 2.57 per month and the average period of stagnant water is about 3 months. Taking the laundry charges as Rs 3/ cloth, the savings per Scheme are calculated as Rs 23.14/ family or Rs 741/ Scheme/ annum;
- With paved streets, the 'Namazis' going to the mosques five times a day save 2.71 minutes per day. Taking total days as 300 per year, wage rate as Rs 75/ day of 8 hours and 30% as capable of doing labor, benefits are worked out as Rs 2705/ Scheme;

⁷ This could be due to high contents of magnesium (Mg) or Sulphur (S).

⁸ at few places, water needs for the livestock are also met from the Schemes.

- Savings on account of lesser need for repair of fallen walls, is Rs 500 per house/ annum or a total of Rs 8000/- per Scheme assuming 50% as beneficiary houses;
- The one time increase in the value of houses on account of improved access is Rs 7500/ unit or Rs 240,000/- per Scheme.

3.9.3 Roads

Roads play an important role in the development of an area. These provide cheaper and easy links for school going children and general public and accelerate economic activity. The population of adjoining villages is also equally benefited. The indirect benefits from Roads surpass the benefits enjoyed directly. There is decreased wear and tear of vehicles, less erosion, easy access during emergencies for patients to and from adjoining towns, easy and efficient transportation of farm commodities from the fields to houses/ market, reduced fare, less transportation charges etc.

The Schemes include kacha/ shingle road links, improvement of existing passages to jeepable tracks, causeways for smooth flow of vehicles during rainy season, culverts, protection walls to check erosion etc. Various types of benefits as given in Appendix Table 5, are summarized in Table 13. The methodology/ assumptions to calculate benefits, is as under:

Passenger fare: With improvement of road links, the fare in 'Post Scheme' period is lessened significantly. The benefits are calculated by multiplying the number of passengers traveling daily on each road (assuming no change in the number of users in pre and post Scheme period). Although the link road schemes are being implemented since the last 6-7 years, the fare in Pre-Scheme period is inflated for just one year using the GDP deflator of 5.4%. Total number of days is taken as 300/ annum to allow for slack season of monsoons. Average benefits work out to Rs 52,779/ Scheme/ annum.

Movement of goods: The transportation costs for inbound and outbound farm commodities, construction material like cement/ sand etc. decrease with improved links. The charges in Pre-Scheme period are inflated using one-year factor and benefits calculated as the difference with present rates. No change in the volume/ quantity of agricultural commodities or construction material is considered, though the speed of construction picks up after road links. Annual benefits are calculated as Rs 525 from Agri. Produce, inputs and cement. The same is calculated as Rs 2314 for sand for which there is appreciable decrease in rate and also the volume of sand lost on the way during transportation;

Household articles: Like reduced fare and transportation costs, the rates for household commodities brought in bulk are also reduced⁹.

Special trips: On certain occasions like marriages, villagers need to hire pick-ups or 'tractor/ trolleys'. The saving on account of reduction of rates of these vehicles, using the number of trips reported, is calculated as Rs 1374/ Scheme.

Savings in the rate of Threshers: Use of wheat threshers is very common these days. With improved passages, the wages for thresher are reduced by an average of one kilogram per maund (40 kg) of wheat/ maize. Taking the yield as 15 maund/ acre, wheat area as 1.5 acres/ family and produce rate as Rs 275/ maund, the savings are calculated as Rs 6188/ annum per Scheme.

⁹ Household articles (sugar, pulses etc.) in small quantities are not charged separately but are covered in passenger fare.

unit, number of farms benefited¹¹ and yield and intensities before the Scheme etc. Average farm area per Scheme for Irrigation and Land leveling is however, assumed as 80 acres for purposes of calculating benefits.

The benefits are calculated in relative terms by estimating the increase in area and yields over the pre-Scheme period (on recall basis) for each respondent. Gross value of production (GVP) is calculated by multiplying production with harvest season prices (Appendix Table 6 and 7). Cost of production is taken as 33% for Leveling and 35% for Irrigation schemes (little high to account for slightly more fertilizer use). Net value of production (NVP) is derived by subtracting production costs from GVP. Benefit calculation for these Schemes is as explained below:

Irrigation: Incremental value of production from wheat and sugarcane is calculated as Rs 193,765 and Rs 79,635 respectively per farm measuring to an average of 3.84 acres. There is no increase from fodder as it is taken as the high priority crop with respect to water use in view of its inelastic demand. Increase from maize is Rs 74,932 per annum. Incremental NVP per Scheme is Rs 59,599 per annum (Table 14).

Table 14 Benefits from Irrigation Scheme/ annum – Rs

Description	Wheat	Maize	Fodder	Veg	S/C	R Fodder
Production before Scheme - tons	205	68	32	30,813	688	185
Production after Scheme - tons	230	77	32	35,399	770	194
Incremental production - tons	25.8	8.6	-		81.7	9.2
Price/ ton - Rs	7500	8750	1375		975	1125
Value of incremental production – Rs	193,765	74,932	-	4,586	79,635	10,392
Total value from respondent farms – Rs						363,311
Total farm area of respondents – acres						327
Incremental GVP/ acre of farm – Rs						1112
Incremental GVP/ Scheme – Rs						88953
Incremental NVP/ Scheme* - Rs						59599

Land Leveling: The activity includes making of bunds and level the field by evening out of crest and ditches and construction of protection bunds to check erosion. Almost all areas where land leveling has been done, is rain-fed. There is a small shallow layer of fertile soil in these areas. Making bunds along the terraces can check the water from heavy rains during monsoons and thus, preserves moisture for crop raising. The activity will also increase water table to some extent by recharge of water within the bunded units. In view of steep slope in the area however, no recharge of groundwater can be expected in hilly terrains of Mansehra. Removal of upper fertile alluvium layer, brings the lower virgin layers on the top. It normally will take some time to have these soils able to produce good crops due to the absence of microbial activity and absence of humus thus, less production in initial years.

The benefits are calculated on the basis of information gathered from the field. It may however, be mentioned that the lands of all the respondents was leveled few years ago and are now producing crop. It is however, difficult to differentiate between a leveled and an unleveled field due to the reason that the bunds wash away due to rain if not maintained subsequently. Further, the activity being very much of an individual interest, is taken up by progressive farmers at their own, without the assistance of SRSP.

¹¹ The number of HHs given in the Scheme is without considering the actual beneficiaries. It is just the number of signatories or the members of the CO who might not be owning any land or may not be even farmer. And there are frequent such cases.

Appreciation of House value: There is appreciable increase in house value with road links. Though there is no buying or selling of houses in rural areas, but based on the field visits, the one time increase is estimated as Rs 3000 per house (used for Financial analysis). The number of beneficiary HHs is taken as 40 HHs/ Scheme to account for indirect beneficiaries.

Table 13 Benefits from Road Usage per year – Rs/ Scheme

Scheme	Passenger fare	Transportation of Goods			Special Vehicle trips	Thresher savings	Total - Rs

3.9.4 Irrigation, Leveling, Crushers

The benefits from farm related Schemes are calculated as incremental farm production. This is on account of increased productivity with intensive input application or extensive acreage. Irrigation Schemes aim at provision of additional irrigation water supplies by new installation/ digging or improvement of existing facilities, check dams to lower water table depth by recharge etc. Land leveling enhances soil moisture preservation, efficient tillage operations, bring additional area under plough, check erosion¹⁰, and consequently increase production. These have demonstration effect in initial stages to make aware the farmers of its comparative advantage in the form of higher production by moisture preservation. Watercourse lining aims at reducing channel losses by rodents, cuts, vegetation/ trees and make additional water available by improved irrigation efficiency for extensive crop acreage and intensive input (fertilizer) use, all leading to increased productivity and production. Cane crushers were supplied to make available the sugarcane crushing facilities at the farms and earn incremental income by renting out to seasonal migratory Sugarcane contractors who crush the cane to convert it to 'gur'.

The beneficiaries do not use some of the Schemes like 'Earthen Dam at Nai Panos' in Kark district or the Wells that are dried up due to drought in recent years. This is attributed to poor planning, less recharge, social conflict amongst the users or absence of cohesion amongst the beneficiaries. To consider this aspect, weighted figures are calculated, based on sampled Schemes. One major problem for assessing the impact of improvements was the absence of relevant basic statistics like area benefited, cost per

¹⁰ The bunding could enhance groundwater recharge but the magnitude of the Schemes and precipitation does not support this.

Incremental GVP from 365 acre respondent farms is worked out as Rs 220,440 or Rs 604 per acre farm. Taking the average area leveled per Scheme as 80 acres, total incremental GVP is Rs 48,316 per Scheme per annum. Further subtracting the cost of production as 1/3rd, net increased production per Scheme is calculated as Rs 32,371 per annum.

Table 15 Benefits from Land Leveling – Rs/ Scheme

Description	Wheat	Groundnut	Maize
Production before Scheme – tons	177.188	57.811	15.444
Production after Scheme – tons	198.352	63.429	16.478
Incremental production – tons	21.1641	5.6174	1.0339
Price/ ton – Rs	7500	9375	8750
Value of incremental production from respondent farms – Rs	158730	52663	9046.6
Total Incremental GVP – Rs			220440
Total farm area of respondents – acres			365
Incremental GVP/ acre of farm – Rs			603.94
Incremental GVP/ Scheme (80 acres) – Rs			48316
Incremental NVP/ Scheme – Rs			32371

3.9.5 Cane Crushers

Twenty two Schemes for the supply of cane crushers were implemented in early 90s, in Charsadda Region. The logic put forth at planning stage was that it will enable the farmer crush cane at their own or the nearby farm and will save lot of time and costs/ wastages. Firstly the implementation of such Schemes is against the government policy of ensuring cane supplies to sugar mills (zoning at some places). Secondly it was observed that the Crushers serve the interest of individual farmer and lack the basic of concept of community participation. The cost of the crusher was almost borne by SRSP in total while community (farmer) share is in the form of land, the room and labor.

The beneficiary farmers at two sites were interviewed. Both these crushers were almost 0.3 kilometer apart. The farmers are interested in crushing cane and convert it into 'gur' for sale at lucrative prices (high demand in adjoining Afghanistan) compared with supplies to sugar mill. The net returns from 'gur' conversion vs. mill supply are roughly 40% higher assuming 9% recovery and sale price of Rs 1200/ maund of 'gur'. However, for purposes of calculating benefits from Crusher, calculations are made on the basis of rent that can possibly be collected from a crusher. Benefits are assumed from the very first year it is installed. Table 16 shows rent collected in a season spreading over to about 2 months (one month peak crushing and 2nd month at 50% utilization).

Table 16 Crusher Charges/ Crusher/ Season – Rs

No. of fillings/ day	5
Gur produced per filling – Kg	75
Crusher charges per filling - Kg of gur	1.5
Crusher charges per day (optimal utilization) – kg of gur	7.5
Active crushing season – days	30
Slack crushing season (50% utilization) – days	30
Crusher charges/ season – Kg of gur	337.5
Charges recovered at Rs 1200/ 40 Kg of gur – Rs	10,125

3.10 Financial Analysis

Average cost calculated on the basis of current prices has been brought to 2002 price level for each type of Scheme. O&M costs (not given in the documents) are estimated keeping in view its requirements. Salvage value is taken in the light of life assumed for each type. Table 17 shows the various coefficients used in the Analysis.

Table 17 Cost, Life and Salvage value of different Schemes

Type	Capital cost -Rs	O&M Costs	Life - years	Salvage value
DWS				
Hand Pumps	257361	Included in Benefits	8	10%
Wells/ Pipes	320000		8	50%
Sanitation	225528	2.5%	8	-
Roads	353305	0.50%	15	50%
Irrigation	314627	0.50%	15	10%
Leveling	272308	-	15	-
Crushers	71347	2%	10	50%

Note: 1- O&M cost for Cane crushers for 1st year is taken as 5%.
 2 – O&M cost for Irrigation Schemes included from 1st year while it is from year 2 onwards, for all others.

A number of activities need to be taken up by SRSP before implementation. These include rapport making or confidence building with the beneficiaries through holding of frequent meetings, planning, execution/ supervision etc. Average expenditure per Scheme is calculated as Rs 25000/- as given in Appendix Table 8. The cost is little high in Mansehra Region (Rs 25730/-) than other areas.

3.10.1 Discounted measures of present worth

Cost and benefit streams are discounted at 15%, the cut off rate adopted by Planning Commission, GOP. NPV, B:C and FIRR have been calculated for each type of Scheme. In addition, Sensitivity analysis has been carried out for Irrigation and Leveling Schemes assuming 10% increase in benefits, attributed to increased demand due to population increase. The results for each type of Scheme are given in Appendix Tables 9 to 14, and summarized in Table 18 below:

Table 18 NVP, B:C and FIRR for different Schemes

Type	NVP at 15%	B:C	FIRR -%	Sensitivity Analysis (+10% Benefits)	
				B:C	EIRR
DWS					
Hand Pumps	87168	1.43	22%	-	-
Wells/ Pipes	86448	1.08	17%	-	-
Sanitation	15783	1.07	20%	-	-
Roads	104014	1.82	23%	-	-
Irrigation	-3796	0.99	15%	1.25	17%
Leveling		0.68	8%	0.75	9%
Crushers		0.62	5%	-	-

Highest return of 23% is calculated for Roads followed by 22% for DWSS (HPs). The lowest return is on investment made on supply of Cane crushers. Irrigation schemes are almost at the break even point. It may also be mentioned that there were abnormal conditions with regard to the availability of water due to drought and failure of tubewells.

Present value of benefits accruing from Irrigation, Leveling and Cane Crushers is less than the present value of costs calculated at 15% discount rate.

3.10.2 Poverty alleviation

Poverty is a relative term, measuring the quality of life on the basis of varying degree of necessities. The contribution of PIs towards poverty alleviation has been gauged as returns on investment. Increase in per capita (direct/ indirect) income has been calculated as follows:

$$\frac{C_a * R_y}{H_b * H_s}$$

Where C_a = Average cost per Scheme borne by SRSP at 2002 price level,

R_y = Return on investment in percentage terms (FIRR)

H_b = Number of Households benefited taken as 32, and

H_s = Average household size taken as 7.5

A part of the cost is borne by the beneficiaries themselves as cash or kind that is around 20%. Therefore, 80% of the cost updated at 2002 price level using GDP deflators, is taken. The increase is however, for the life period of the Scheme as shown in Table 19. Salvage value is not considered being negligible in terms of its present value. Total yearly increase is also calculated by multiplying per capita increase with the number of Schemes.

Table 19 Contribution of PIs towards Poverty alleviation

Scheme Type	No. of Schemes	Returns/ year - %	Life - Years	SRSP Investment/ Scheme – Rs	Per capita yearly increase -Rs	Total Persons benefited	Total yearly increase - MRs
DWSS	813	22%	8	205,889	188	195120	36.66
Sanitation	55	20%	8	180,422	154	13200	2.03
Irrigation	180	17%	15	251,701	176	43200	7.61
Levelling	151	9%	15	217,846	85	36240	3.07
Crusher	22	5%	10	57,078	12	5280	0.06
Road	379	23%	15	282,644	276	90960	25.13
Misc	56	10%	13	175,542	76	13440	1.02

Per capita increase is the highest for Road Schemes (Rs 276 per year) followed by Water Supply (Rs 188) and Irrigation Schemes (Rs 176). Land leveling Schemes contribute Rs 85 per capita while lowest figure of Rs 12/- is calculated for Cane crusher schemes.

4.0 Lessons Learnt

The whole concept of SRSP revolves around poverty alleviation of the masses or the communities through their own organizations. Poverty can be defined as lack of resources that hamper or prevent participation in events and relationships that give life meaning. It leads to inequality and thus, a sense of deprivation. Provision of basic necessities like water and sanitation etc. is a pre-requisite for living beings. Leaving aside the financial aspect, these need to be provided on social grounds. Roads are important for undertaking any economic activity. They not only provide easy access but also make possible the generation of economic activity and thus, have multiplier effect.

Community Organization or the CO refers to the common cause of the group of people or society. It aims at providing equal opportunity to all its members to make use of the facilities/ infrastructures created. Lessons learnt in the light of Study carried out are given below along with the suggestions for further improvement:

4.1 Baseline information

Benchmark data is essential for subsequent evaluations or even its monitoring during the currency of works being executed. Standard forms (Agreements) have been designed for various Schemes. There however, is lack of information regarding the benchmark data for the community as a whole. It has the name of the members but not the particulars for the members like father's name, identification, number of dependents, socio economic conditions etc. While stress should be on socio-economic conditions for Schemes like water supply, sanitation or road, it should contain information about farm size, cropping pattern, yield level, market access, per unit cost involved etc; for any agriculture related Schemes.

4.2 Connectivity/ Data Standardization

Data maintained in the computers is not on standard formats. Same information is recorded by all the SOUs but the way of its presentation differs for different offices. Instead of maintaining a Master file and deriving information from it, the information is repeatedly recorded under different file names, thus over-burdening the computers. The organization is well equipped with modern gadgets like computers, E-mail/ Fax/ Telephone. It however, lacks connectivity for efficient updating of information that can be attained at comparatively lower cost. There is need to design standard formats and process the information efficiently by establishing MIS. Nomenclature for different type of schemes should be uniform as should be the way of maintaining records¹². This will facilitate data processing. Entering information in pre-decided Columns in a Spreadsheet program that is being used by all the Offices in SRSP would even facilitate the work to a great extent. Annex 4 contains guidelines for data entry.

4.3 Maintenance of Schemes

All Schemes require some sort of maintenance to keep these in running conditions. The Agreement reached between the CO and SRSP stipulates that the COs will be responsible for the maintenance of completed Schemes. Unfortunately the SRSP staff does not visit these places subsequently nor the COs discharge their responsibility adequately. At many places, the maintenance is poor, particularly of Sanitation/ Drainage Schemes. The distribution pipes for DWSS are disconnected or leaking. Gorges in the Roads due to erosion/ damaged protection walls, can be seen frequently (see notes for individual sites, given as Annex 2).

One Scheme is allotted to a CO. Having realized the benefits of a Scheme, the beneficiaries try to have another one sanctioned for their locality. For this purposes, they make another CO with new names (non-listed members, children, women etc.). While

¹² Great difficulty was faced in processing of data due to lack of standard names for the PIs.

there is no harm in implementing another Scheme in the area, the maintenance of previously allotted Scheme should be considered as a pre-requisite for allotting the additional Scheme.

4.4 Nature of Schemes to be implemented

SRSP is implementing varied nature of Schemes. Some of these Schemes benefit only a segment of the community or are in the interest of individual member. These include land leveling or supply of Cane crushers. Even on financial grounds, these are at the lowest level. Irrigation schemes benefit the farmers the most, especially the small farmers. Schemes relating to lining of watercourse at individual farms (well irrigated watercourses) should be discouraged.

4.4.1 Lining of Watercourses at Dug Wells

Dug Well can hardly irrigate an area of 4-5 acres to the maximum. The Scheme consists of lining 6 - 7 watercourses at different places (in the same locality). The farmer on whose farm the Well is dug, benefits from this investment. Assuming that the water from the well is shared by neighboring 2-3 farms (keep in mind the optimal water availability and average farm size), the level of benefits derived will be different for different farmers and that too for 2-3 farmers at a site. It however, benefits the farmer on whose farm the channel is lined. Further, due to high irrigation efficiency at lined watercourses, the rate per unit of time hired by the neighboring farmer will be high compared to an unlined watercourse. Thus, it benefits to the individual farmer and not the community.

4.4.2 Land leveling

It yields benefits in the form of even application of irrigation water that hardly is the case in rain-fed conditions. It does however, aids in moisture preservation by bunding. Removal of topsoil (that is just few inches in most of the areas) will be destructive in terms of crop productivity, at least in the initial year or two. Bund making is in the interest of an individual farmer (benefits in the proportion of area leveled). The objective of 'moisture preservation' in areas with steep slope like Mansehra Region (terraces) cannot be attained due to high seepage. Making of protection walls, a component of land leveling, checks erosion and thus, saves valuable top soil. In view of aforesaid, the farmers should be encouraged to have their lands leveled from their own resources.

4.4.3 Supply of Cane Crushers

The Crushers benefit the individual farmer on whose farm it is installed¹³. Rent is charged even from the farmers who are the 'so-called' members of the CO in whose name the Scheme was approved. Gauged on the basis of returns on investment even, the investment is not justified.

4.4.4 Dug Wells for Irrigation

The discharge/ water availability of dug well can hardly meet irrigation requirements of 4-5 acres of land (130% cropping intensity on an average with mixed cropping). Taking the average holding as one acre, it will serve the interests of about 5 farmers (at full discharge) that hardly can be termed as a 'Community'. It is said that a Scheme consists of 6-7 Wells and is thus, in the interest of the Community. Whatever, the criterion, the returns are not shared equally by all members¹⁴.

4.4.5 Check Dams

The dams help in raising water table, raise trees ultimately leading to improved precipitation and thus, the environment. These are a valuable source of water for nearby residents for drinking/ laundry and for the animals. Even though the direct benefits from

¹³ Cane crushing is in general against Government policy as being in competition with sugar mills.

¹⁴ There are instances that non-farming persons are also the members of COs.

such dams are not reaped to the full, such activities in water deficit areas like Kohat need priority.

4.5 Community Contribution

Contribution (cash or kind) leads to a sense of ownership of the entity. There are instances that CO has not made any contribution in some of the Schemes or contributed too less like as under USAID/ CIDA Schemes in Charsadda Region. Community participation should be the foremost criteria for undertaking any investment.

4.6 Cohesion of the Community

Community Management refers to bringing the masses into an organized fold. No sustainable development is possible without the involvement of community. SRSP has successfully implemented a number of Schemes in all areas. Unfortunately, some schemes have failed in their infancy (before these could be completed). Similarly some could not yield the desired level of benefits due to differences amongst the members. Still some are not maintained properly due to non-cooperation of the members. It is time that SRSP stresses more upon consolidation of the Communities rather than expansion. Efforts need to be made to reactivate dead COs and inculcate the sense of ownership.

4.7 Involvement of Women

About 1/3rd of the Schemes are implemented as WCOs. Their participation is ensured by involving them in various Committees formed for implementation. Due to age-old traditions and cultural values, it is not possible for the society to leave what they are practicing since centuries and adopt new traditions. All out efforts should however, be made to empower women, enable them to develop confidence to face the challenges themselves and involve them in decision-making. Incentives like lesser CO share for WCOs in case of their active participation in implementation can be considered.

4.8 Scope/ Quality of Scheme/ Works

The cost of the Scheme fluctuates widely in various years for all types. Given a constant scope of the Scheme (no change observed in the number of beneficiary HHs or the population) and sticking to the quality of work executed, it should logically rise due to inflation. Alternately the quantity/ size of work should have decreased.

4.9 Ranking of Schemes:-

SRSP makes assessment of the Schemes to be implemented in the light of financial ranking and need stressed by the community. Meeting basic needs is morally more important than reducing inequality. Schemes like drinking water and access to other areas is the basic need of any area. In order to minimize the personal bias while prioritizing the Schemes, ranking is suggested to be in the light of Matrix given as Appendix Table 15. The suggested marking is just in the light of field observation and discussion with respondents that can be altered depending upon the specific objectives and conditions.

Appendix Table 1: Schemes implemented in different years in Various SOUs under various Programs

Appendix Table 4: Benefits from DWS Schemes

Description	Average time involved in bringing water/ family after Scheme - hrs	HPS	Wells/ Pipe
Time in bringing water presently			
Total time at present - hrs	1.00	—	1.25
by Adult females - %	60%	80%	
by Children - %	40%	20%	
Equivalent adult female time - hrs	0.80	1.13	
Time taken before Scheme implementation (Streams/ Springs)			
by Adult females - %	1.70	1.70	
by Children - %	2.03	2.03	
Equivalent adult female time - hrs	2.72	2.72	
Time saving/ HH/ day - female hrs.	1.92	1.59	
Value of time saved/ annum/ HH - Rs	3498	2905	
Savings on account of decreased diseases/ annum - Rs	220	220	
Total annual savings - Rs	3718	3125	
O & M costs/ month at present	100	100	
Net savings after meeting O & M costs - Rs	2518	1925	
Average HHs/ Scheme - No	32	35	
Value of time saved/ annum/ Scheme - Rs	80575	67369	
Average Capital cost - Rs	257361	320000	

Note: Capital cost for Wells is calculated assuming a unit of 8 Wells costing Rs 40,000 each.

Appendix Table 5:

Basis for Calculating benefits from Roads

Scheme	HHs benefited	Persons travelling/ day	A - Basic Coefficients			Appreciation in house value @ Rs 500	Thresher charges reduction - Rs
			Fare/ passenger before Constant 2002	Present fare - Rs	Appreciation in house value @ Rs 500

ANNEX - 2
NOTES ON SCHEMES VISITED

ANNEX - 2

NOTES ON THE SCHEMES VISITED

- 1.0 Irrigation
- 1.1 Lining of Channel in Ralsan, Hangu
The channel originates from the foothills and irrigates vast areas (1752 acre cultivated + 2612 acre Banjar Qadeem + 35 acre Banjar Jadeed). It benefits not only the local residents of the area but a vast number of Afghan refugee households use water from this channel. Unfortunately, there is little water since the last 2-3 years due to drought.
- 1.2 Lining of Channel in Ustarzai Bala & Ustarzai Payan
The Irrigation Scheme was initiated by WCO. The channel originates from spring and was lined under MPA funds for Rural areas, later extended by Railway Department to safeguard the track and now further extended by SRSP. The point of origination located just near the Kohat-Hangu Road, is a very good picnic spot. The latest extension is for about 200 ft. There is enough water to meet irrigation demands of farm area. Somehow, the width of channel extended under SRSP was reduced to about 2 ft from 3 ft in the upper reach. Due to sliding from adjoining high areas, frequent overtopping of the channel is reported by the farmers. They even opine that it was better not to have undertaken this Scheme. High value fruit crops like Guava (famous of the area), Apricot and vegetables are grown. The channel is not maintained properly.
- 1.3 Lining of Channel at Ibrahimzai, Hangu
The channel was lined to meet high water needs of crops. Due to drought however, there is no cropping in the area. Orchards planted in expectation of water availabilities, have not matured.
- 1.4 Lining of Channel for Well Irrigation in Mohalla Pirachagan, B.D.Shah
The depth of the well is about 125 feet. There is little recharge and consequently little water available for irrigation. Channel is lined practically for just one farmer. Farmer contribution is in the form of labor.
- 1.5 Lining in village Kaag Mohallah 3, in Haripur
Mr. Mian Khan, the Councilor is the lead person. There was complete change of cropping pattern, in favour of high value vegetables due to lining of the watercourse, originating from Tubewell. Total length measures to about 1.5 kilometer. Presently traditional crops like wheat and maize (rain-fed) are grown. The shift to pre-improvement crops is attributed to tubewell breakdown, since the last 2 years. Though the channel is maintained properly, the farmers do not have control over tubewell.
- 1.6 Lining of Channel in Bajeeda Mohalla U.C., Haripur
The village is a model for CO contribution in various developmental activities. Mr. Shah Nawaz s/o Malik Habib ur Rehman is the lead person. The watercourse was constructed in 1988. It measures to about 5 km. In pre-improvement period, there were frequent breaches and also intentional cuts by upper reach farmers. The channel has been lined in stages under different programs. The village is a model of cohesion of the society. It has benefited a lot in the form of 3-4 Schemes implemented in the name of one or the other CO. The villagers unite after every Friday prayer at the place of Mr. Shah Nawaz, discuss various problems and take policy decisions in this regard. There are two tubewells – one for irrigation and the other for drinking water requirements. Irrigation T/W is out of order since 6-7 years and since the last few days, the other one was also not functional. The CO approached concerned quarters, collected money, used the transformer and starter of Irrigation Tubewell and got the DWS tubewell, in running condition. Due to drought and non-functioning of Irrigation T/W, there is no water in the

watercourse. The farmers have now shifted to traditional crops. Total area of CO members is 100 acres. The savings of water due to lining made possible the application of irrigation water to an additional acre of about 50 acres that was previously rain-fed. Irrigation

1.7 Dam in Nari Panos – Karak:

The Dam surrounded by rocks was built at a cost of Rs 290,000. It aimed at providing irrigation supplies to adjoining area (acreage not known), decrease depth to water table by recharging the aquifer and meet drinking water supplies for nearby village, Mohalla Aleem Khel. It was auctioned at Rs 50,000 in 2001 for one year but the deal did not materialize due to the mutual rift amongst members. Presently there is neither irrigation supply nor water made available for drinking purposes. Even the trees planted along the borders have been uprooted or damaged by livestock. Drinking water supplies of the locality are met with from the dug wells in adjoining village at a distance of about one kilometer. It is priced at Rs 100 per point per month for supplies of 4 minutes a day. In all water is supplied at 12 points for the entire locality. Dam serves the water needs for the livestock and washing requirements.

1.8 Watercourse Lining in Wadapagga, Peshawar

In view of high construction cost, more than one schemes are merged for lining this channel. There are three parallel channels at the head reach, but at varying levels from the soil surface. The Wadapagga watercourse is little at higher level than the adjoining 2 channels. The farm area is much downstream the off take point. The farmers were suffering in the form of cuts or breaches to adjacent two watercourses and thus, little water supplies in the command area. Out of a total length of 6500 rft, 2400 feet are lined at a cost of Rs 700,000/. Member contribution was Rs 200 per acre. High value crops like vegetables, fruits are grown in the area and thus, high opportunity cost for water. Water allowance is 0.30 minutes/ acre.

1.9 Irrigation Tubewell Amankot, Peshawar: The Scheme was implemented at a cost of Rs 254000. CO contribution is Rs 45000. It was meant to irrigate 40-50 acres land. However, due to some fault in installation, it is not working.

1.10 Irrigation/ DWSS Katch Banda Kark: Syed Hussain Badshah s/o Rasul Bux, the key person for the Scheme, is a very dynamic and well-informed person. He is running a health related NGO funded by Japanese. The Irrigation Scheme/ DWSS is implemented by the W/MCO in village Katch Banda near Kark, in 1999. Overhead tank is built to store water. The Scheme though sanctioned as an Irrigation cum DWSS, is primarily meant to irrigate the farm area owned by Mr. Badshah. Water is sold to adjoining farmers at Rs 20/hour. In view of low discharge of the Well, water from the Overhead tank (3" dia outlet pipe) is also released along with lift irrigation from the well (1.5 HP motor). A well distributed valve control system is laid out throughout the farm area. It takes normally 2.5 hours to irrigate one kanal farm land. DWSS needs of the village are met by PHE tubewell installed there. However, to meet emergency needs for drinking water purposes, provision is made through the Overhead tank.

2.0 Cane Crushers

Cane crusher Behlol Payan, Charsadda: It was supplied to the farmer in 1996 at a cost of Rs 75,000. The farmer provided land, constructed room and is enjoying with nominal contribution from his own side. The crushing season lasts for 2 months roughly. At peak season, the crushing is about 100 maunds per day or 375 kg of 'gur'. The crusher is hired out at 1-2 kg per maund of 'gur' to adjoining farmers (who are also the members of the CO).

An other crusher is also supplied to the farmer in the neighborhood of the above said site (about 0.5 km). Charges are generally in cash - Rs 50 to 60/ maund of 'gur' from all

farmers, whether members or non members. Due to some differences with adjoining farmers, crusher is not rented out to them and is not optimally used. Some cane contractors do however, crush cane sometime at this site. Crushing season is generally 2 months – one month peak and 2nd month at 50% of the average crushing (about 10 maunds/ day).

- 3.0 Leveling
- 3.1 Leveling in Dhunga Makori, Kohat
The members are allotted equal time for land leveling (said to be 2.5 acres for each member). In case the farmer does not want to have his land leveled, he is compensated in the form of cash payment. Similarly the non-farmer members are compensated. No opinion could be made about the quality of land leveled as there is no difference of this land at this stage from the adjoining non-leveled land. Farmers however, reported higher cropping intensity and better yields in leveled area.
- 3.2 Leveling in Teri Village, Kohat
The Scheme was allotted to WCO. However, Mr. Zahoor Ahmad was the active member. A total of 130 acres of land was leveled. Protection bunds have been made to store rain water in the field. No opinion could be made about the quality of work or the effect on productivity etc. The hiring rate for tractor varied from Rs 90 to Rs 200/ hour.
- 3.3 Leveling in Malakabad II in village Kaag, Haripur
Demand for area that required to be leveled was given by members, land levelled according to funds available, level ranges from 1 ft to 2 ft. above average surface. Dozer rate was Rs 600/ hour. CO contributed to Rs 47,000 while SRSP paid Rs 197,000/- The area is all 'barani'. Traditional crops like wheat and maize are grown.
- 3.4 Leveling in Malakabad I, Haripur
Out of a total of 43 members, 37 are the farmers. Total area for which the Scheme was sanctioned amongst all members, to be leveled shared amongst members. Non farming members were compensated in the form of credit advanced for some enterprise like livestock etc. A total of 25 acres was leveled at a cost of Rs 197000/-.
- 4.0 Sanitation
- 4.1 Street pavement at Hyatabad Hangu
Street measuring 110 ft. has bee paved and drains constructed along its sides. Construction quality is good and beneficiaries are maintaining the drains, on regular basis, on self help basis.
- 4.2 Sanitation at Bari Banda, Kohat
The streets are newly constructed. The bricks are not grouted, rather sand filling is observed. It was completed recently.
- 4.3 Drainage/ DWSS in Walai, Naushera
The Nazim initiated the Scheme. The Drain construction was stopped due to some differences but the matter was subsequently resolved. Water was brought from streams.
- 4.4 Drains in Village Ziarat Kakakhel, Naushera
Only one person contributed 20% of the cost on behalf of whole village.
- 4.5 Street Pavement in 'Mohallah Nai Abadi' in Havelian
District Council built the drain in the upper reach but quality of construction was not good. The work done by SRSP is of good quality but unfortunately there is not enough maintenance. Even grass or weeds have grown up in the bed. Drain is choked with mud and poly bags. Cost of the Scheme was Rs 127,000/-.

- 4.6 Street Pavement Balla-Hangu-Chumm-Gurda, Oghi
To overcome the cost ceiling, the Scheme implemented as a joint venture of 4 COs. The localities (small settlements) are located near Kadhai BHU. The Scheme is a model for the work that can be done by the community. The lead person is Haji M. Maskeen Khan (PAF Retd) s/o Ghulam Jan who also served abroad in USA. The settlements are just on the brink of a stream that flows almost continuously throughout the year. The streets were full of mud, pits and water damaging the walls. Almost every house needed to be repaired every year. Drains are provided along the streets. The vehicles can now reach the door of every house. The sewage water is disposed off in adjoining fields or finds its way to the nearby stream. The value of houses has increased appreciably.
- 5.0 Road
- 5.1 Causeway at Ibrahimzai, Hangu
The Causeway has made possible year-round connection of the village to main road, by checking soil erosion from the stream. The village is about 5 miles from Hangu. Prior to the construction of Causeway, the road was frequently closed due to rise of water table, during monsoon floods or heavy rain. It has opened up the avenues for economic activity like employment in transport, plying of passenger vehicles, easy transport to/ from the adjoining Hangu town etc.
- 5.2 Mir Adam Klauy Link Road, Karak
The Shingle Road built under BADP, off taking from Indus Highway, measures about 1.5 Km. A small patch in the center is not built due to non-cooperation of 2-3 families owning nearby land. The settlements along a distance of about 5 km are benefited from this. Datsun pick-ups are plying over this Road. The MCO of Mir Adam Klauy, at a distance of 2 km got this Scheme implemented but residents of areas upto 5 km length enjoy its benefits. About 20 wagons operate from morning to evening including the 5 wagons owned by nearby village owners. There has been significant reduction in transport fare. There however, is negligible local farm production, all rain-fed. There was some saving of amount that was used for street pavement.
- 5.3 Shahalam Johar Link Road in Tangi, Charsadda
It is about one kilometer long shingle road. The area is very fertile with lot of tobacco and high value crops grown. Other Schemes like Drain, DWSS is also implemented there. The farmers have benefitted in the form of reduced transport losses, increased value of dwellings, reduced expenses on maintenance of walls, mud-free movement of pedestrians etc.
- 5.4 Link Road at Kacha Garhi Chowki Darab, Naushera
This WCO Scheme benefits some 8-10 villages. CO contribution was in the form of cash mainly. Three commercial weaving units have been established in the village.
- 5.5 Khabbel Road near Mansehra
The area is conspicuous due to its steep slope, difficult for pedestrians too. It is about 2.5 km long jeep able track, constructed 2 yrs ago. It also links to the water tank constructed for DWSS. The cost was Rs 310,000/- . The road was extended by about 0.5 km by the villagers at their own expense.
- 5.6 Bao Bandi Link Road, Mansehra
The Road was initially built by District Council but subsequently improved by SRSP. It is some 3 km long. The road was widened, culverts made, protection bunds constructed to check erosion etc. Datsun pickups/ tractors are plying here. Special wagons are now easily available at much less charges (Rs 150/ vehicle against 200 previously). Total investment was Rs 270,000/- . The area is now well connected to metalled road.

- 5.7 Akhtarabad Link Road, Battagram
It is 1.25 km long Kacha Road connecting two roads that has decreased the distance significantly to the advantage of nearby villagers. The land was given free of cost by one Mr. Anwar Zeb s/o Ajoon Khan. Datsun pick-ups, special wagons and tractors can frequently be seen. Fares are reduced for transport and passengers.
- 5.8 Link Road in Majuhan, Abbottabad
It is a pity that there are certain areas so disconnected, at this time. The Majuhan village is at the top of a hill, some 3 km away from Bodla-Haripur Road. District Government built a small 0.5 km track originating from Bodla. SRSP extended it to village Majuhan few months back, under PPAF funding. The area was so difficult that even pedestrians could not easily approach it. With the opening of area to outside world, a jeep owned by one Mr. Iqbal, retired Army person, is continuously shuttling between Majuhan and Haripur twice daily, making it easier for residents to move. The fare charged per passenger is however, high at Rs 20 per passenger. Transport charges have decreased from Rs 30 to Rs 20 per mauld now. Tractors are running. The cost of transporting threshers has reduced considerably to the advantage of farmers in the form of reduced threshing charges. Construction activity has started. 'Pucca' houses are now being built. The cost of transporting sand, previously done by donkeys, is now by pick-ups or trolleys. The transport losses during transportation have reduced considerably.
- 5.9 Terori Link Road, Havelian
This village Terori is just one km apart from Majuhan but one has to travel by about 6-7 km to reach there. With the opening up of area by the Link Road, a contractor has landed in there to explore the possibility for coal/ mineral extraction. He has started construction of road (jeep able track) with heavy machinery, making it possible the connection of Majuhan and Terori. This road was also initially taken up by District Government but that was not well planned or well implemented. There is however, erosion at many places and damaged protection walls. The beneficiaries do however, realize the benefits in the form of better communication, reduced fare/ transportation charges, house value/ land value appreciation, accelerated economic activity etc. They have pooled their financial sources and are keen to improve the road after the monsoons.
- 6.0 Water supply
6.1 Hyatabad DWSS
Hand pumps are installed for the convenience of roadside settlers – fragmented settlements. Previously these people were served by two water points provided by the local residents, from the wells inside their own houses. There used to be long queues that has now been reduced to 4-5 minutes/ trip.
- 6.2 Ande Sharki Water supply, Kark
The Scheme was implemented few years back under BADP. Water was lifted from a spring using 18 HP diesel engine and stored in tanks in the village at a distance of about 0.5 km that were connected to the source through pipes. To meet financial requirements for the maintenance and meet wages for the operator, differences arose amongst the members. The CO was almost at the brink of dismemberment when Mr. Israr, the teacher and his friend volunteered to work as operator, without any financial emoluments. Contributions were originally made @ Rs 1000/ HH. The CO managed to have some funding (Rs 143,000/-) under the 'Khushal Pakistan' and used it to have the electricity to the village and to the Spring site (electric poles, transformer etc). Additional amount of Rs 1500/ HH was raised to convert the diesel engine to electric powered motor along and starter etc. The two volunteers worked for 2 years without any financial reward. Now however, the members themselves realized and have fixed their salary at Rs 800/- per month. The accounts of the Committee are very well maintained and are open to scrutiny

by any member, without notice. The CO had Rs 7000/- as the balance in middle June 2002.

6.3 Choki-Khabbal-Danna DWSS, Mansehra

Water was brought from nearby wells/ springs and average time per trip was 0.30 minutes. An average family had to make 3-4 trips a day to meet their domestic water needs. The residents complained of some 'boils' on the body very often that they attributed to the water from the well/ spring. To overcome the cost ceiling (Rs 3.0 lac approximately per Scheme), the Scheme was taken up as a joint venture of three COs namely, Choki, Khabbal and Danna. It is around 20 km from Mansehra on the road leading to Balakot. Two overhead tanks are constructed, the main one at higher level that also feeds the one at lower level to make water available at the nearby point. These are filled through pipes originating from the spring. A 2" dia pipe terminates at the upper tank. Water is stored in lower level tank at some distance through 1.5" dia pipe. Water is made available at various distribution points connected through 0.5" dia pipe network. Total length of the pipes measures to 9,000 ft. The Scheme is well maintained and people too happy.

6.4 Navi Garhi DWSS, Oghi

The residents used to bring water from springs (3 #) that are at a distance of 0.25 to 0.75 km from the village. Now, 8 Wells are dug, well dispersed in the village. All the springs are now dried up due to drought. The Scheme benefits some 100 HHs. Some of the persons did not become members due to difference of opinion with regard to the lay out of well locations. Average cost per well is around Rs 40,000/-.

6.5 Banda Jalal Khan DWSS, Battagram

It is a WCO Scheme. Water is made available to people through pipes (at nearby distribution points), from the nearby spring. Previously the women/ children used to travel to the spring to bring water. In view of acute shortage of water due to drought, there is not enough water available presently. It is presently shared by two localities, by allocating time.

6.6 Maidan Balal DWSS Battagram

The Scheme substituted nearby spring water (0.5 km) by piped supply from the stream to the locality. Unfortunately, the Scheme is not well maintained. The pipes are disjointed and leaking. There was no water on the day of visit. Even no supplies in the mosque to make 'wudu'. No revolving fund is maintained to keep the Scheme in proper condition. It benefits some 33 households.

6.7 Dug Wells in Ehsanabad, Battagram

The area was served by stream that is dried now. The residents complained of stomach problems with the water supplies from the stream, not only to the human beings but also to the animals. The Scheme consists of 3 wells with good quality of water, serving some 30 houses.

6.8 Waziran DWSS, Abbottabad

District Government constructed the Water Supply Scheme few years ago by constructing a tank and connecting it to the spring. Pipes were laid out in the locality. The old pipe network is not well maintained (leaks, disjoints). Due to water shortage and expansion of village (population increase), SRSP constructed the new scheme including a tank (at a little higher altitude than the previous one) but not affecting the existing source and distribution system. Some T points are however, made available for the already benefitted houses in case it is required. The residents of old 'Basti' complained that Pesh Imam Sahib who is the President of the Tanzim, did not allow the old beneficiaries to have well designated distribution network in their area and even in new area. About 100 HHs are benefitted from the Scheme.

6.9 DWSS Sere, Haripur

This is an MCO Scheme whereby tubewell has been installed, some 6 months ago. Around 100 HHs of village (Awan Beradri) and many adjoining area houses are benefited. Pipe layout in the village and one tank was already constructed by PHE as a part of an adjoining scheme but those people did not cooperate to provide water to Sere village. As such the new T/W was installed by SRSP but using the pipe layout in the village + one tank already constructed. Total cost Rs 405,000/-.

6.10 DWSS Bodla Mera Payeen, Haripur

Three hand pumps have been installed, in 1999. Two of these are inside the private house premises.

ANNEX - 3

PIs IMPLEMENTED IN VARIOUS REGIONS

Schemes under BADP-1 in Abbottabad District of Abbottabad Region

S.No	SOU	Name of CO	CO type	Scheme type	Description	Cost - Rs			Beneficiary HHs		Year

ANNEX - 4

DATA ENTRY IN SPREADSHEET FOR VARIOUS PIs.

The data entry or the pattern of information available with different offices of SRSP varies from each other. If one has given the number of beneficiaries of a Scheme, the other has not. If one enters a particular information in say 'row 3 od Column C', the other gives the same information in say 'row 3 of Col. D' and so on¹. If one writes the name of Community say 'Rehmanabad' in one Column and its Type (CO) in the next one, the other writes it as 'C/O Rehmanabad'. Similarly one writes the name in Capital letters while other in 'Sentence Case'. All this makes computerized analysis very difficult.

In order to facilitate computerized processing of data of various PIs, a standard format needs to be designed. The headings of various Columns need to be pre-fixed. In the light of available information in various offices, it can be on the following lines:

Title Progress Report of PIs implemented in... Regions till the month of ...

<u>Col. No</u>	<u>Title</u>	<u>Contents</u>
1	S.No	Continuous numbering irrespective of the location with respect to SOU.
2	SOU	Write the name of SOU where the Scheme is identified/implemented.
3	Scheme/ U.C	Some write it in 'Capital letters', while others in 'Sentence case'. Still others write it as 'W/O REHMAN ABAD' or 'C/O KAMALI BANDA' denoting the type as 'Female or Male Community' and name as 'Rehman Abad' or Kamali Banda. The pattern should be standardized preferable by writing the name in 'Sentence case'.
4	CO type	Following abbreviations should be used: MCO for Male Community Organization, WCO for Women Community Organization, and W/MCO for Women/ Men Community Organization.
5	Membership	Give the number of members.
6	Type	It has two sub-columns viz. Category and Description.
6a	Category	The nomenclature for various type of Schemes or Infrastructure should be standardized. Presently, various 'Categories' include DWSS, Drainage, Street pavement, Leveling, Irrigation, Cane crushers supply etc.
6b	Description	In case there is some secondary use or some off-shoot is to be given, it should be mentioned in the next column, under 'Description'. For example, a Tubewell for irrigation may also be used for drinking water supply purposes. So the Category will be 'Irrigation' and 'Description' may be 'also DWSS'.

¹ Columns and Rows are mentioned instead of Fields and Records as all the offices are using 'Microsoft Excel Spreadsheet' instead of any Database.

7	Commencement	The date of approval or commencement is given. Mention of the month and year may also suffice the purpose but it depends upon end use requirements.
8	Estimated cost	Write the cost as approved.
9	Expenditure	Like 'Commencement', the month and year may be sufficient. This Column may be divided into three Sub Columns as follows: Till last month, During current month. Total till reporting month.
10	Remarks	Some unforeseen description that may aid in assessing the performance.
